

Why should I use MRL Hydraulics as my hydraulic fluid and lubricants supplier.....?

It's a fact that you can buy hydraulic lubricants from a number of fine reputable suppliers, some who you have probably been doing business with for quite some time. Given that all things are equal the decision to use one supplier over another usually rests on four factors: product, availability, price, and service. Most lubricant suppliers are expert in lubricants and lubricant applications. However, what they are not well versed in is fluid power systems and process applications. This is where MRL comes in.

MRL was founded by a group of multi-disciplinary professionals with decades of experience in lubricant technologies, fluid power systems, and application design engineering. The group recognized that if the user was to be provided with the best possible hydraulic lubricant solution that all three major disciplines had to be involved. This is especially important in today's market where so many users are seeking alternatives to the traditional choices of lubricants. Over the last 30 years there has been a growing awareness of the environmental impact that traditional lubricants have on the health and safety of people and the planet. Whether through legislation, regulation or good environmental stewardship there is ever increasing pressure to find lubricants that go beyond just providing good lubrication for the equipment. The ideal lubricant is one in which no performance characteristics are lost, it has wider parameters of operation, it extends the life of the equipment beyond that of traditional lubricants, it doesn't require a change of equipment already in use, it is environmentally benign, easily cleaned up, worker safe, and at a price that is affordable. The pursuit of ideal lubricants has led MRL to focus strictly on synthetic hydraulic lubricants.

First let's state that there are a number of companies marketing synthetic hydraulic lubricants, some are quite good and know what they are doing, while others leave a lot to be desired. A critical question to ask is whether they are a manufacturer and blender of the products or are they just marketing for someone else? Relying on manufacturers and blenders is usually a safe way of separating the legitimate suppliers from the less reliable sources. Manufacturers and blenders stand behind the products they make and will not risk their business and reputation just to make a quick buck by misapplying the lubricant. They are more concerned with the lubricant's performance and are more likely to match the right product with the application. MRL Hydraulics is a blender of synthetic hydraulic lubricants. We only use the finest materials from the world's largest chemical manufacturers, strictly control the blending and packaging processes, and provide a finished product properly designed for your system needs. To assure that we are providing the right product for your application requirements we take it a step further, we offer a free application analysis by one of our fluid power and process application professionals. Our analysis involves the review of the following:

Fluid power system design	Process application parameters
Maintenance schedules and procedures	Equipment risk
Flammability risk	Environmental risk
Worker impact	

Based on the analysis we then will make a written recommendation and quotation for your consideration.

The value added service that MRL Hydraulics provides does separate us from all the others. It provides you with the assurances that when you use us as your hydraulic lubricants supplier that you are getting the best value for the money. Contact MRL Hydraulics for your free application analysis and see for yourself why MRL should be your hydraulic lubricant provider.
